Compositing Compositing in Photoshop allows you to combine two or more layers on a photo into one new image. You can paste an effect, text or image on top of an existing photo. There are many advanced features like layer masks, clipping paths, and adjustment layers in Photoshop. Photoshop layer masks can be used to isolate parts of an image, as well as to create interesting effects. The Clipping Path is an area on an image that doesn't contain any parts of the image. This allows you to create complex effects like a borderless frame for a photograph, or a transparency applied to the bottom of a shirt. The Blur Tool lets you create an interesting blur effect. You can change how wide the blur will be or the amount of sharpening that will be applied. The Grain Effect lets you simulate the look of film. The Grain Effect is one of the most complex tools in Photoshop. It is not easily mastered and requires lots of practice. The Dodge and Burn Tools help add light or dark contrast to an image. These are useful in creating certain effects. You can control how the effect is applied to the image using the Variation options. The Exposure Variation allows you to change the brightness of the overall image, while the Color Variation allows you to change the saturation, which can make dark images appear more vivid. The Opacity Variation allows you to control how much the effect is applied. You can adjust the amount of difference between the original image and the one being modified by adjusting the Opacity setting. The Gradient Tool is an excellent tool for creating different effects. With the Gradient Tool, you can create a gradient. You can adjust the colors of the gradient to create many different effects. You can also use this tool to combine two or more images into a new image. The Gradient Fill can be used to create new gradients without needing a gradient tool. You can choose from a range of colors and create a gradient. The Pen Tool lets you create a drawing tool for filling free-form shapes and strokes. You can also create shapes by editing shapes in the Shapes Toolbox or by pressing the Letter P or the Backspace key. You can also use the Pen Tool to draw on top of a layer in Photoshop, drawing anything from logos to text to images. Use the Shape Tools to select and modify shapes, then use the shape to create new paths or shapes.

-1.5- Cl was lower than that of $\text{Pt}(\text{Nac})\text{Cl}-1.5$. The structure-property relationships of Pt-based catalysts could possibly be related to the electronic state of the metal centers and the surface metal atoms. The electronic state of transition metals is related to the rate of reaction, and the catalytic activity of the CO oxidation could change depending on the nature of the atom. To gain insight into the electronic state of the Pt atom in the Nac-Pt(IV) complex, we estimated the DOS at the Fermi level, as shown in [Fig. 2(f)](#fig2[ref-type="fig"]). It was calculated based on the density functional theory (DFT) with the PBE functional. The DOS of $\text{Pt}(\text{Nac})\text{Cl}-1.5$ was higher than that of $\text{Pt}(\text{Nac})\text{Cl}-1$ because there was no lone-pair orbital on the nitrogen atom of the Nac ligand. The electronic states in the d-band were mainly contributed by the orbitals of the Cl and Pt atoms. Especially, the electron-deficient d-orbital of Pt contributed to the higher reactivity of the $\text{Pt}(\text{Nac})\text{Cl}-1.5$ complex. On the other hand, the electronic states of $\text{Pt}(\text{Nac})\text{Cl}-1.5$ were lower than those of $\text{Pt}(\text{Nac})\text{Cl}-1$. This is probably related to the coordination of a five-coordinated Nac ligand. The lower activity of the $\text{Pt}(\text{Nac})\text{Cl}-1.5$ complex should be associated with the coordination of a hexacoordinated Nac ligand. !{(a) The CO pressure-time profiles of $\text{Pt}(\text{Nac})\text{Cl}-1$, (b) $\text{Pt}(\text{Nac})\text{Cl}-1.5$, (c) $\text{Pt}(\text{Nac})\text{Br}-1.5$, (d) $\text{Pt}(\text{Nac})\text{Br}-1.5$ +
